SUSPENSION ADJUSTMENT

Your bicycle will have been delivered with the suspension manufacturers user manuals, we suggest that you read them carefully, and refer to them if you have the slightest of doubt. Before carrying out any adjustment on your suspension, make sure that the compression adjustment is completely liberated. This means that there should be no propedal, lockout or other such system activated. If this is not done, the compression values of your suspension would be inaccurate

FRONT SUSPENSION

To adjust the front suspension, please refer to the manufacturers user manual delivered with the bicycle.

REAR SUSPENSION

_1. Sag adjustment

All of our full-suspension bicycles are equipped with our proprietary suspension system, referred to as the Contact System. This system has been conceived so that the rear shock compresses when you sit on the bicycle, leading to fantastic grip and control of your bicycle. For ease of understanding, this is adjusted by measuring the axle-to-axle distance of the rear shock with the rider sitting on the bicycle. Adjustment is carried out as follows:

• Sit yourself on the bicycle normally, as if you were riding, with hands on the handlebars, and feet on the pedals. It is easier to do this while leaning up against a wall or a fence.

• While remaining on the bicycle get a friend to measure the axle-to-axle distance A (please see overleaf) of the rear shock. With this measurement taken, refer to the Contact System adjustment table that can be found with the technical spec sheet of our bicycle, so as to compare the measured values with the recommended ones.

• If the values measured do not correspond, it is necessary to adjust the spring preload of your rear shock. This can be done either with a high-pressure shock pump in the case of an air shock, or by adjusting the spring preload ring for helicoidally sprung shocks.

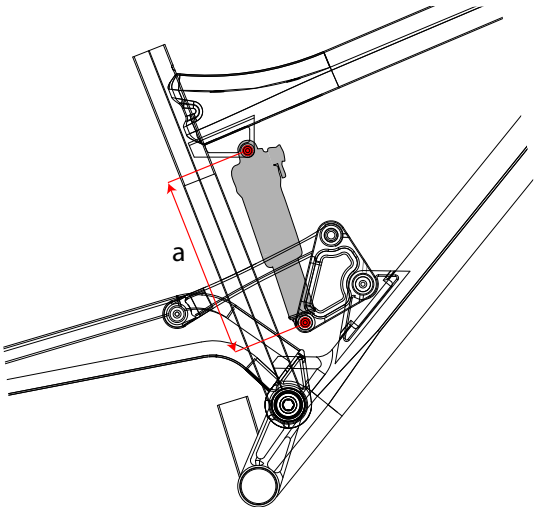

_2 . Rebound adjustment

The rebound adjustment manages the extension speed of your shock after it has been compressed. To adjust this, ride off of a curb while remaining seated on the saddle of your bicycle. Your rear suspension should stabilize in less then 2 oscillations. If this is not the case, adjust the rebound rate via the adjustment knob, often red in colour. The more you screw in this knob, the slower the rate of return of the suspension, and vice versa.

Rebound adjustment takes a little bit of experience to be adjusted correctly. The ideal adjustment will depend on the type of terrain ridden and your style of riding.

_3. Other adjustments

It is possible that your suspension has other adjustment possibilities, such as an anti-bob adjustment. To adjust such systems, please refer to the rear shock manufacturers user manual, delivered with the bicycle.

Incorrect adjustment of your rear shock can result in irreparable damage. If in doubt, do not hesitate to get your local Authorized Commencal retailer to adjust it for you.

For the ideal working balance between the front and rear suspension of your bicycle, make sure that they are adjusted with similar levels of sag.

CONTACT SYSTEM ADJUSTMENT TABLE

Sag is the shock compression value when the rider sits on the bicycle at a standstill. In this case sag is expressed in a percentage value of the total travel of the rear shock. The axle-to-axle value should be obtained with the rider seated on the bicycle. Adjustment of your suspension using the Contact System adjustment table should be done while referring to the suspension adjustment sheet delivered with your bicycle.

META 6	***SAG %***	***Rear shock axle-to-axle distance***	***Comments***
SAG optimum	20%	188mm	This adjustment will give you optimal performance in all types of terrain
SAG mini	14%	192mm	This adjustment will give you firmer suspension, suitable for rolling terrain
SAG maxi	25%	186mm	This adjustment will give you softer suspension, suitable for rougher terrain

CONTACT SYSTEM ADJUSTMENT TABLE

Sag is the shock compression value when the rider sits on the bicycle at a standstill. In this case sag is expressed in a percentage value of the total travel of the rear shock. The axle-to-axle value should be obtained with the rider seated on the bicycle. Adjustment of your suspension using the Contact System adjustment table should be done while referring to the suspension adjustment sheet delivered with your bicycle.

META 5	***SAG %***	***Rear shock axle-to-axle distance***	***Comments***
SAG optimum	20%	190mm	This adjustment will give you optimal performance in all types of terrain
SAG mini	12%	194mm	This adjustment will give you firmer suspension, suitable for rolling terrain
SAG maxi	25%	187mm	This adjustment will give you softer suspension, suitable for rougher terrain

If your Commencal bicycle has front suspension, it is important to adjust it according to the type of riding you do, and your riding style.

Please refer to the suspension fork manufacturers instruction manual for adjustment instructions. This manual is delivered with your bicycle when new.

Incorrect adjustment of your suspension can result in irreparable damage to your bicycle. If in doubt, please contact your local authorized Commençal Bicycles retailer for help.

ADJUSTING THE HEAD ANGLE

META 6, SUPREME & SUPREME DH

IN ORDER TO ADAPT YOUR COMMENCAL BIKE'S HANDLING FOR THE DIFFERENT TERRAIN YOU RIDE AND TO YOUR RIDING STYLE, YOU HAVE THE OPTION OF MODIFYING YOUR BIKE'S HEAD ANGLE.

Your bike is delivered with two head tube sleeves:
• a silver 0° sleeve, mounted on all Supreme, Absolut 4X and Meta 4X, as well as the Meta 6 in size S and M
• a black +/- 1° sleeve, delivered with the bike
• an anthracite grey +/-0.5° sleeve, mounted on the Meta 6 in size L and XL wich is specific to these models

HOW TO ADJUST
The +1° and +0.5° positions are suitable for slow trail conditions, when you need good manoeuvrability, the trade off being less stability. The +1° position offers the most manoeuvrability.

The 0° position is the intermediate position.

The -1° and -0.5° positions are most suitable for rapid trail conditions where stability is important. The bike will be less manoeuvrable. The -1° position will offer you the most stability.

To choose the +/-1° head angle (or the +/-0.5 angle, the principal is the same), you will need to position one of the two slots situated on the ring at the bottom of the head tube sleeve so that it is central to the front of the headtube.
If you place the narrow slot at the front, you are in a + position.
If you place the wide slot at the front, you are in a – position.

ADJUSTMENT
• Loosen the stem, the headset, and the top yoke if you have a dual crown suspension fork.

• Loosen the two bolts **A** on the head tube.

• Turn the head tube sleeve **B** half a turn with your hand to the desired position. Make sure that one of the two slots **C** is facing forward in a central position to the headtube.

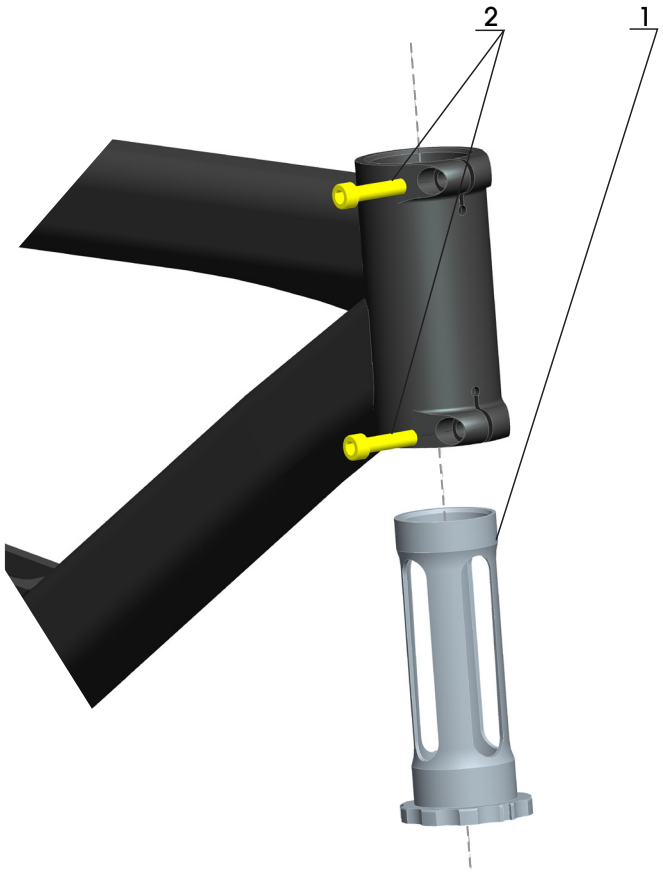

• Re-tighten the head tube **A** bolts with the correct torque setting (10Nm).

• Adjust the headset and tighten the stem bolts as indicated in the bike owners manual, delivered with the bike.

If you wish to use the 0° sleeve, it is necessary to remove the suspension fork and the headset so that you can replace the sleeve. This is a complex operation that needs specialist tools and knowledge. Head to your local Commencal Bicycles Authorized Retailer so that they can carry out the operation.

An anthracite grey +/-0.5° sleeve is available as an aftermarket for all Suprême, Absolut 4X and Meta 4X, as well as the Meta 6 in size S and M

ADJUSTABLE HEAD TUBE SLEEVE

ITEM	KIT CONTENT	GENCODE
