UPG[illegible]ES FROM Y11

Y22

- Manitou X-Vert suspension fork
- Fox Air Vanilla C rear shock with remote adjuster
- Shimano Deore XT V-Brk

OBSTACLES ARE NO OBSTACLE. Every full-suspension Y Bike® features Trek's patented Fully Active Uni-Link™ suspension—so the rear shock is always on duty, all of the time. And the patented Y configuration puts the pivoting shock mount where it does the most good—whether your weight is in the saddle or you're up on the pedals. Unlike other suspension designs—which can compress or extend your drivetrain when you pedal—Trek's Unified Rear Triangle keeps chain length constant. So pedaling translates directly into maximum forward motion, little wasted effort. Which translates directly into maximum fun. For '98, we sweetened the package with a new adjustable shock mount, more responsive steering and more. (And you just thought it looked cool.)

FOR '98, ANOTHER REASON "Y". With longer travel and plusher suspension than the "original recipe" Y, the Y Glide opens the ruggedest terrain to riders of wide-ranging skill levels. You don't need to be a pro racer to handle the Glide. Early feedback: "You can roll right over stuff. You can hit big logs and barely feel it!"

For serious downhilling, the Pro Issue DH delivers 6+ inches of travel, front and rear. Genuine off-the-shelf version of the same frame the Trek Volkswagen Team races at World Cup downhill events.

OFF ROAD

THE LIGHTEST PRODUCTION HARDTAILS ON THE PLANET.

The credit goes to OCLV® carbon. OCLV is Trek's own patented carbon composite technology. The OC stands for "Optimum Compaction," which means the carbon fibers are tightly packed (we maintain a ratio of 65% carbon fiber, 35% thermoset epoxy matrix). The LV is "Low Void," which is engineer-speak for squeezing the bubbles out (the air pockets, or "inconsistencies," are held to under 2 percent – on a par with aerospace standards). Bottom line? OCLV is an extremely dense frame material with extremely high Specific Ultimate Strength (meaning, for example, the strength in 1 lb. of OCLV equals what you'd get in 4+ lbs. of Cro-Moly steel). So it takes less OCLV to make a really strong frame. And where lightness is concerned, less is always more.

...between 15% and 20% stronger than industry-standard 6061 aluminum. The large diameter tubing maintains a rigid, straight-tracking frame that gives you maximum output for your pedaling effort. Plus the strength to hold up under a real off road pounding. Built to a proven racing geometry that delivers lightning response for the slightest rider input. We micro-tune the geometries to be exactly size-specific, so every size rider gets maximum performance. And every Alpha is protected by Trek's Limited Lifetime Warranty.

OFF ROAD

HIGH PERFORMANCE STEEL FOR ALL ABILITIES.

It's not as lightweight as aluminum, but steel enjoys an avid following of riders who prefer steel's natural ability to dampen the bumps on a rugged trail. The riding position on the 900s is more "aggressive" (forward-leaning), the 800s more "laid-back." If you're ready for some truly technical riding, the 900s have the sharp handling and climb-ability to go after the steepest, slipperiest, most boulder-strewn singletracks. And if you're sticking to trails that are a little more tame, the 800 bikes won't let you down. Trek engineers designed these bikes to be solid recreational performers.

excellent visibility makes it easy to navigate in traffic, or just to enjoy the [illegible] on a country ride. MultiTracks also possess moderate off road capability, enough for unpaved fire trails or rails-to-trails off road gravel paths. The MultiTracks are designed for easy handling that will forgive a little "errant" steering. After all, the idea is to look around and enjoy the view, not keep your eyes glued to the asphalt!

TREK OCLV: THE LIGHTEST PRODUCTION BIKES ON THE ROAD. Truly race-ready. In fact, off-the-shelf 5500s are the very bikes the US Postal Service Team raced in the 1997 Tour de France – the very same 5500s on the dealer's selling floor. New for '98 is the revolutionary Y Foil, Trek's aerodynamic bike, a design only made possible by Trek's patented OCLV carbon process. No other frame material possesses the strength-weight ratio of Trek's OCLV, so no other frame can be as strong and stiff, yet weigh so little. And thanks to OCLV's unique directional properties, these frames maintain good lateral stiffness while keeping enough vertical flex (or "compliance" as the engineers say) to dampen road vibration – a feature much applauded by our USPS riders when rolling over the rugged cobbles of the European race circuit!

UPGRADES FROM 1220

2100

ROAD

TREK ROADIES: TWO-WHEEL CURE FOR WHITE LINE FEVER. Technology never stands still. And recent advances in welding technology made it possible for Trek to develop economically priced bikes in performance Alpha Aluminum. The new 400 road series is Alpha 7005 T6 aluminum, an alloy 15% stronger than the industry standard 6061 used by other makers. While the new 470 and 420 are almost a full pound lighter than Trek's old steel road racers, their price remains comparable to many of the steel bikes in our competitors' showrooms.

Adjustable stoker stem

touring bikes like the 520 [illegible]
started with in 1976. The spirit of '76 lives on—load it up with full bags and hit the open road!

Tandems are most popular with couples, so Trek Tandems use a "direct lateral" frame design, best when riders are unevenly matched. Trek's got both a "head-up" enjoy-the-view model, as well as a roadie for serious Tandem speed.

TREK BMX: BUILT TO TAKE "THE BIG HURT" AND LIVE TO TELL. Take some extreme measures and find out what we mean. King Kong tubing, double-thick dropouts and massive headsets thrive amid chaos. Full lines of race and freestyle in aluminum and steel.

WHAT COLOR WAS YOUR FIRST BIKE? Getting kids started right can lead to a lifelong love affair with cycling – and with fitness. Trek's got a full line of kids bikes, from our tiniest Mountain Cub with 12" wheels all the way up to the Mountain Track 24, a genuine off road bike – front shocks and all – with 24" wheels to fit young riders. While they're priced like some department store lines, Treks are different. Every kids Trek has brazed or welded-on dropouts where the axles attach; department store bikes often just have a flattened tube end with a hole for the axle drilled through. And every kids Trek is made with bicycle grade high tensile steel, not the plain milled steel others use. Every bike is designed in Wisconsin by the same team that creates our most advanced Treks. And Trek quality people monitor the manufacturing, every step of the way. Limited Lifetime Warranty.
