
DAHON®
freedom unfolds
ANYWHERE
& ANYTIME
PERFORMANCE

IN A DAHON BIKE
YOU HAVE EVERYTHING
YOU NEED TO UNLOCK
THE FREEDOM TO RIDE

ANYWHERE,
ANYTIME,
AND ANYTHING.

URBAN

From work, to cafes, to play, you can go anywhere, at anytime.
Ride one-way or round trip; hop on public transit or stow it in the trunk.
Performance when you need it; out of the way when you don’t .

Your DAHON, your choice!

URBAN

RECREATIONAL

There is no better way to get around for fun and health than on a DAHON. A short pedal through the park or long ride outside the city.
The bike for the whole family. Ride anywhere, anytime, and anything.

Your DAHON, let's ride!

ROAD / TOUR

DAHON is also built for speed and distance. DAHON is out to prove itself to the most discerning bike enthusiasts. Uncompromised performance will let you power up an ascent, control on the descent, with the comfort to stay on the saddle for a day or a week, and the flexibility to hitch a ride.

ROAD / TOUR

TECHNOLOGY

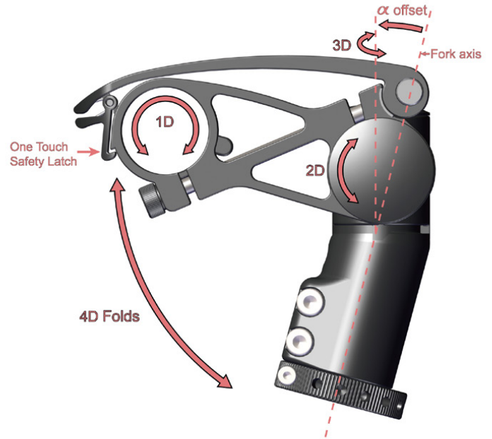

Award winning and patented DAHON technology is at the heart of everything we do, from the smallest component right up to our folding frames.
We push ourselves to innovate and originate to bring you the best ride and the ideal fold for your lifestyle.

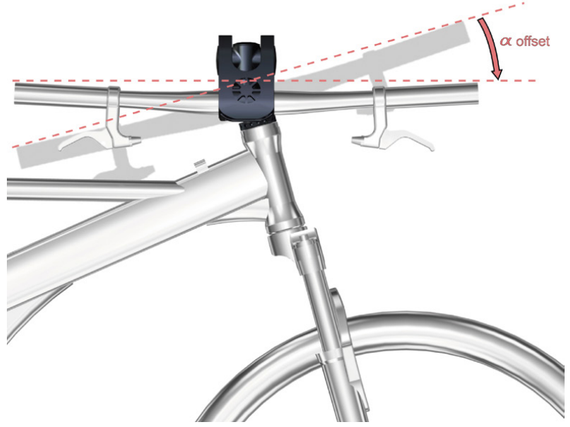

TECHNOLOGY

D4D

Cyclists and inventors have been dreaming of a handlebar stem that is fully adjustable for various riders and riding conditions. DAHON is no exception, and after years of dedicated work DAHON has finally come up with a true breakthrough. The award winning Quickpark D4D stem can adjust the handlebar's height, reach and axial angle; in addition it can rotate the handlebar 90° around a vertical axis to lie prone against the bike. Part of DAHON's Flatpak technology, the D4D stem answers the call of riders' needs for a tailored fit and practical storage, all in one smart action and a beautiful design. Trying is believing, and its reliability has been proven by DAHON's own CEN-certified lab. The D4D features in the 2016 bicycle range and will follow as a separate accessory, allowing users to adapt all kinds of bikes with DAHON technology.

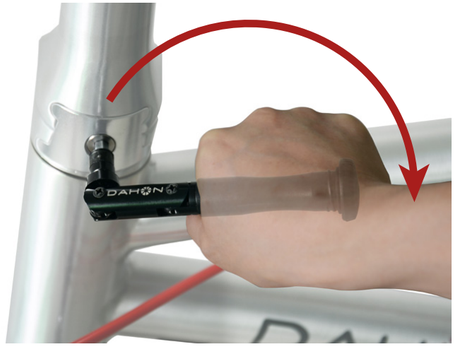

DATOOL

Datool is a wonderful little gadget, a simple but fast and powerful hand tool, invented specifically to replace quick-release latches in bicycles in general but especially for the purpose of folding/unfolding them. It is particularly useful in our Flatpak technology. Being faster than a ratchet wrench but equally powerful in most cases, it has quickly caught the eyes of the hand tool industry!
The Datool can eventually dominate. Here it includes 4 and 5 mm hex tools for tightening and adjusting the bolts on your DAHON, especially in hinges and joints. The tool kit is easily accessible in the handle-post stem where it stores conveniently and invisibly. You will see a proliferation of applications way beyond our Flatpak technology and other folding bicycles.

For storage

For leverage

For speed turning

FLATPAK

The folding bicycle is great for urban mobility.
But despite great strides, riders may still want or need a full sized and more traditional bike.
DAHON has done its homework and come up with a series of technology that can turn any regular bike into one that folds conveniently, preserving the strength, rigidity and looks.
In most cases, you can't even tell that the bike is foldable.
With Flatpak you get a bike that goes from 3-D to 2-D in seconds, storing almost completely flat.
The narrowest space becomes your bike's "garage", with no one getting caught on protruding parts, pedals or handlebars. Further innovation comes in the form of the Datool, a hex tool hidden away in the handlebar with two joints that allow for high speed or high torque applications, and the award winning 4D Quickpark stem that allows for flat storage and almost limitless riding position adjustments.

What you see here is only the beginning.

JIFOLD TECHNOLOGY

In 2014 DAHON introduced the small and charming Jifo to market.
As the name suggests, it was the first to feature Jifold technology that allows the bike to fold vertically as opposed to the more common horizontal approach.
Folding this way allows not only for a tiny footprint, but super-fast folding to boot. The compromise in riding comfort is negligible for its intended urban use. An ingenious connecting rod automatically extends and contracts the height of the seat post, and doubles as the "downtube" of the front triangle, thus providing great strength for such a small bike.

Hot on the heels of the Jifo came our award-winning EEZZ. This bike features a sleeker, hydro-formed Dalloy frame and flush frame latch. With the addition of a 3-speed compact rear derailleur (co-developed with Shimano), and a custom twist shifter with indicator, the EEZZ D3 is all urban versatility and style.

The third in our line-up of vertical folders is the Qix. This bike takes the design advantages of two 16" bikes, the Jifo and the EEZZ, and applies them to a 20" bike, creating a ride with a larger seating position and range. Vertical folding technology allows the Qix to roll directly into a folded position with the minimum effort and time. A rear carrier with in-built guide wheel allows it to roll easily along when folded. And when unfolded, its sleek hinge and flush latch are practically invisible. It all makes for one slick looking bike, whose big secret is how small it can fold.

INVERTED HANDLEPOST

DAHON engineering turned everything upside down, by creating a handlepost and steerer that are one piece, to add stiffness, and by moving the clamping function to the fork crown, reducing redundant material and saving weight. By use of the DaTool, it allows for a clean, fastener-free look that sets the Clinch apart from the crowd.
